A post-doctoral position is available in the laboratory of Human Cellular and Molecular Neuropharmacology led by Dr. Ginetta Collo, Division of Pharmacology, Department of Molecular and Translational Medicine, University of Brescia, Italy.

The position is on the project “Neuroinflammation in major depressive disorder with anxious distress: a precision medicine approach based on human cell biology, imaging genetics, and biomarkers of inflammation”, funded by Fondazione Cariplo, Milan.

We are looking for a highly motivated PhD scientist with a strong background in cellular and molecular neuroscience and experience in stem cell biology and iPSC technologies.

According to WHO Major Depressive Disorder (MDD) is one of the major contributors to the global health burden. The molecular neurobiology of the disease is only partially understood and we are interested in contributing to the development of novel Precision Medicine approach to this disorder.

The selected candidate will generate iPSC from somatic cells donated by MDD patients whose clinical, genetic, immunological and neuroimaging profiles have been characterized by the group of professor Francesco Benedetti (Università Vita e Salute San Raffaele). Neurons and oligodendrocytes will be differentiated for in-vitro studies so to provide a translationally relevant model of the disease.

This position requires a frequent contact with the clinical team to discuss the results, therefore the candidate should be culturally interested to work with a translational mindset.

The position will be funded for one year and renewable up to 3 years.

The deadline for application is October 15th, 2020.
